

**ABSTRACT OF THE DISCLOSURE**

Disclosed is a vacuum cleaner filter which is detachably mounted into a dust collecting chamber of a main body of the vacuum cleaner and which filters dust contained in the air sucked into an air inlet of the dust collecting chamber, said filter comprising: a cylindrical filter body  
5 having a plurality of open parts and an external screw section on the outer periphery of the upper part thereof; a porous filter paper for covering the open parts; and a cover having a through hole fitting with the air inlet and an internal screw section corresponding to the external screw section. Since the cover is screwed to be tightly fastened to the filter body, it is possible to secure a complete closing of the filter body with the cover even when the filter is used for a long time.
